

WOUND SUIT

The **WoundSuit** is the most versatile trauma training aid available. The WoundSuit can be used on existing training mannequins or worn by role players. The WoundSuit utilizes a “Plug n Play” wound management system not found on any other mannequin or training device.

ABOUT THE WOUNDSUIT

Circulatory System

WoundSuit has a pressurized bladder system to feed the “arteries” of the suit. The system utilizes one-way valves allowing wounds to be reconfigured on the fly for the most versatile trauma training system available.

Wounds

There are several sites on the suit for wound placement. The wounds include a “Junctional Wound” for wound packing training, a non-bleeding “Sucking Chest Wound”, and a “Gunshot” wound that bleeds. The wounds utilize our plug and play system allowing for quick change of wound placement.

Versatility

Unlike training mannequins, the wounds can be quickly moved from location to location allowing for a new training scenario every time. Students will not be able to predict wound placement until their medical assessment begins.

Ease of Use

No electronics, no batteries, no remote control. Very few moving parts make this training device one of the easiest to use and maintain.

One Size Fits Most

The WoundSuit is designed to fit almost anyone, allowing for use with role players or for use on mannequins. Slip the suit on over shorts and t-shirt for the most realistic training evolutions available.

Existing Mannequins

The suit can be used with role players or with your existing training mannequins. Use your favorite training mannequin to enhance the training scenario.

Skills

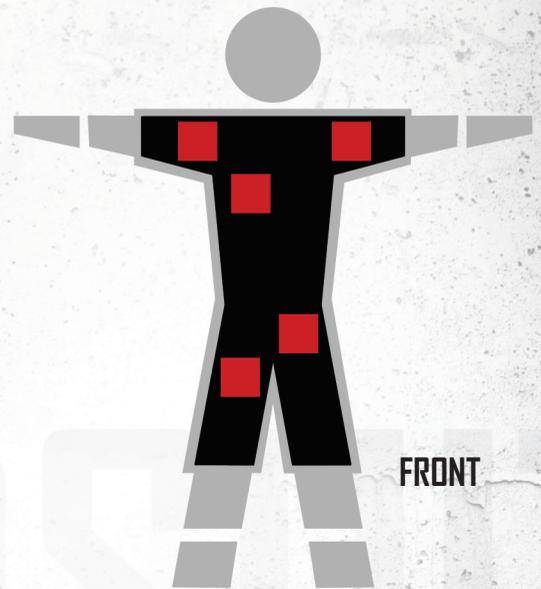

Use tourniquets to stop arterial bleeding, hemostatic dressings to pack wounds, and chest seals to cover sucking chest wounds. You can also practice pressure dressings with Israeli or similar dressings, and basic trauma care and first aid with the WoundSuit.

Training Programs

WoundSuit is compatible with TCCC, TECC, LEFR-TCC, B-CON, PHTLS, Active Shooter, and any other training program requiring tourniquets, wound packing, chest seals, and trauma training.

WoundSuit Jr.

Pediatric version of WoundSuit. Same features as WoundSuit but in smaller size for children role players and childsize mannequins.

JUNCTIONAL PACKING WOUND

SUCKING CHEST WOUND

GUNSHOT BLEEDING WOUND
